(a) Pump-fed rocket

(b) Pressure-fed rocket

$$m_{prop}c_p \frac{T_2 - T_1}{\tau_1} = \varepsilon \sigma \left[\left(\frac{T_1 + T_2}{2} \right)^4 - T_{amb}^4 \right]$$

	N_2H_4	N_2O_4
τ (h)	121.1	91.9

$$C_F = \frac{F_R}{p_c A^*}$$

$$C_F = \left\{ \frac{2\gamma^2}{\gamma-1} \left(\frac{2}{\gamma+1} \right)^{\frac{(\gamma+1)}{(\gamma-1)}} \left[1 - \left(\frac{p_e}{p_c} \right) \right]^{\frac{(\gamma-1)}{\gamma}} \right\}^{1/2} + \left(\frac{p_e}{p_c} \right) \frac{A_e}{A^*}$$

$$t_w = \frac{p_b r_c}{F_{tu}}$$

CÁLCULO DEL VUELQUE

OBJETIVO: Obtener velocidad rotación

- Conservación momento cinético:

$$\frac{dL}{dt} = 0$$

$$\left. \begin{array}{l} \text{- Previo al choque: } L = M \cdot h \cdot v_h \\ \text{- Tras el choque: } L = I_O \cdot \omega \end{array} \right\} \omega = \frac{M \cdot h \cdot v_h}{I_O}$$

CÁLCULO DEL VUELQUE

Condición de vuelque:

$$E_c < E_p$$

$$0,5 \cdot I_o \cdot \omega^2 < M \cdot g \cdot H$$

Donde:

$$H = r \cdot (\sin(\theta + \phi) + \sin\phi)$$

El vuelque se da:

$$\theta + \phi = \frac{\pi}{2}$$

CÁLCULO DEL VUELQUE

En un plano inclinado

El vuelque se da cuando:

$$\theta + \phi + \alpha = \frac{\pi}{2}$$

$$H = r \cdot (\sin(\theta + \phi) + \sin\phi)$$

En el equilibrio de energía:

$$0,5 \cdot I_o \cdot \omega^2 < M \cdot g \cdot (\cos(\alpha) - h)$$

CÁLCULO DEL VUELQUE

En nuestro vehículo:

$$I_o = 8148,4 \text{ Kg} \cdot \text{m}^3$$

$$Ec = 411 \text{ J}$$

$$Ep = 5755 \text{ J}$$

$Ec < Ep$: No vuelca

Ecuación de Friis

$$\frac{E_b}{N_o} = \frac{P_t * L_t * G_t * L_a * L_s * G_r}{k * T_s * R}$$

Pérdidas en espacio libre, $L_s = \frac{(4 * \pi * d)^2}{\lambda^2}$
